

A woman with curly hair and glasses is looking at a screen in a control room. The background is dark with blue and yellow light effects, suggesting a high-tech environment. The text is overlaid on the left side of the image.

# OT Cybersecurity for Food & Drink Manufacturers: Where to Start and What Matters Most

Food & Drink Federation

Quentin Menuisier

# Quentin Menuisier

Cybersecurity Business Consultant

Focus on OT cyber security for the UK&I zone

# F&B challenge

Food & beverage manufacturers are rapidly digitalising their operations, connecting production environments to IT systems and external partners.

However, these OT environments were not designed with cybersecurity in mind, creating significant operational risk.

As a result, organisations face increasing exposure to cyber threats while maintaining strict constraints on uptime, safety, and compliance.

# Agenda

---

- 01 IT vs OT
- 02 The new paradigm
- 03 Regulation overview
- 04 Cybersecurity activities vs risk
- 05 Key activities in F&B

# Introduction

Cyber

**People**, Human error, such as falling for phishing scams, is a major vulnerability. Effective security relies on training, creating a culture of awareness, and defining roles and responsibilities

**Processes**, These are the policies and procedures that define how technology is used and how threats are managed, including incident response plans and access control policies

**Technology**, Hardware and software solutions that protect digital assets, such as firewalls, antivirus software, encryption, and intrusion detection

ISO27001

Confidentiality & availability

IEC62443

Safety & availability

Focus

Technology

COTS (Commercial off the shelf)

Mostly proprietary hard & software

Lifecycle

3-5 Years\

15-30 Years

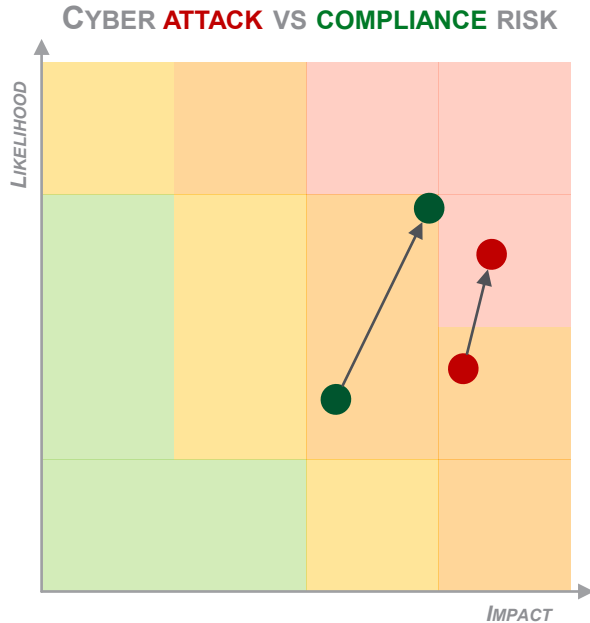

Change

Mostly unproblematic

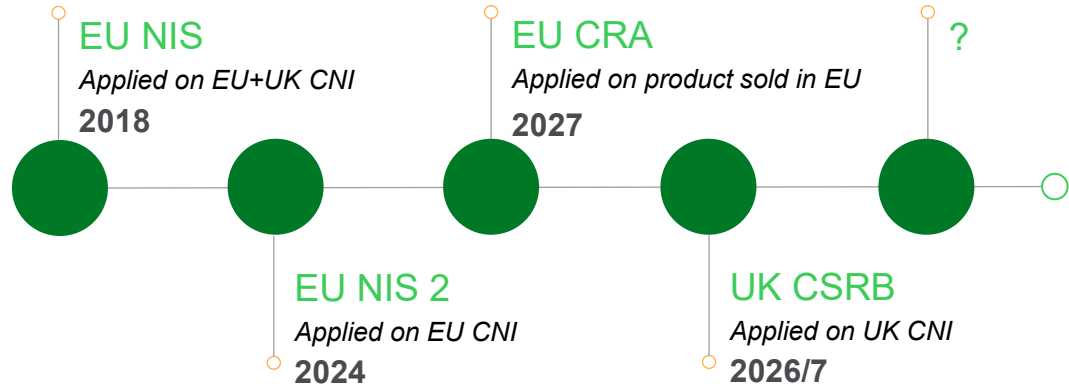

Usually requires production standstill

# The new cybersecurity threat paradigm

*The measures implemented by governments and institutions require organisations to adapt to increasingly prevalent cyber threats, which in turn increases the risk of non-compliance*

## CYBER REGULATION LANDSCAPE

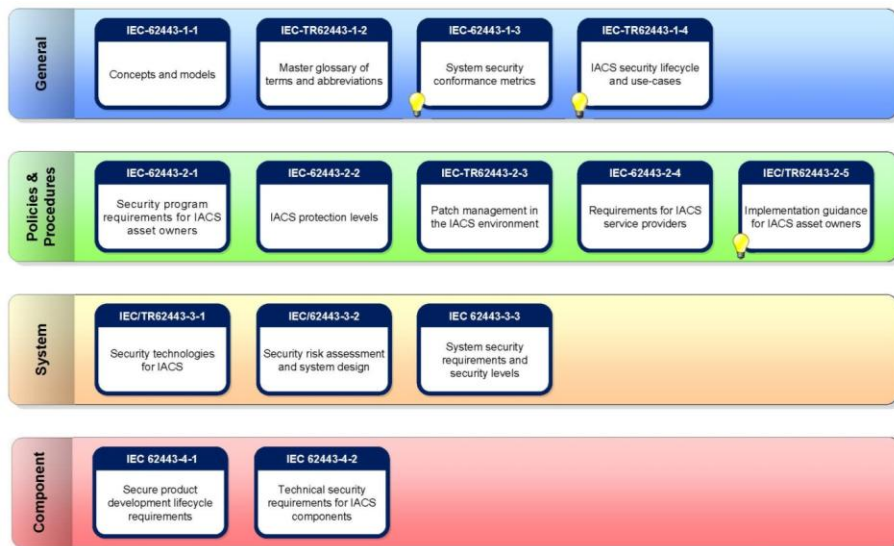

- **Country regulation** says "Manage your risks"
- **CAF** says "This is what we believe good looks like when you manage your risks"
- **ISO 27001 / IEC 62443** "here are some lower-level things you should do to manage your risks"

# Regulatory Content

<b>Objective</b>	<ul style="list-style-type: none"><li>• Protect a country's critical infrastructure and essential systems</li></ul>
<b>Scope</b>	<ul style="list-style-type: none"><li>• Critical National Infrastructure / Operators of Essential Services</li><li>• Critical suppliers</li></ul>
<b>Defined Regulator Powers</b>	<ul style="list-style-type: none"><li>• Introduces <b>stricter, earlier and broader</b> incident reporting obligations.</li><li>• Requires organisations to notify regulators faster and with more detailed information on disruptive cyber events.</li></ul>
<b>Cyber risk management</b>	<ul style="list-style-type: none"><li>• Regulators gain authority to conduct <b>proactive investigations</b>, not only to react after incidents.</li><li>• Strengthens ability to set and enforce requirements across sectors.</li></ul>
<b>Incident detection &amp; response</b>	<ul style="list-style-type: none"><li>• Water, energy, transport, and other CNI operators must implement stronger <b>supply-chain oversight and governance</b>.</li><li>• Regulators can directly regulate high-risk suppliers through "Critical Supplier" designation.</li></ul>
<b>Incident Reporting Requirements</b>	<ul style="list-style-type: none"><li>• Regulators can <b>charge organisations</b> to recover the costs of enforcement, oversight, and investigations.</li></ul>

# IEC 62443 as a reference standard

IEC 62443 is an international series of standards that addresses cybersecurity for operational technology in automation and control systems

Asset owner operator  
Sections 2-1, 2-3, 2-4

System Integrator  
Sections 2-4, 3-2, 3-3

Product / solution provider  
Sections 3-3, 4-1, 4-2

## Security levels within IEC62443

SL1

Employee errors

SL2

Cyber crime, hackers

- Low Resources
- Low Motivation
- Simple Means
- Generic ICS Skills

SL3

Cyber terrorism, hacktivist

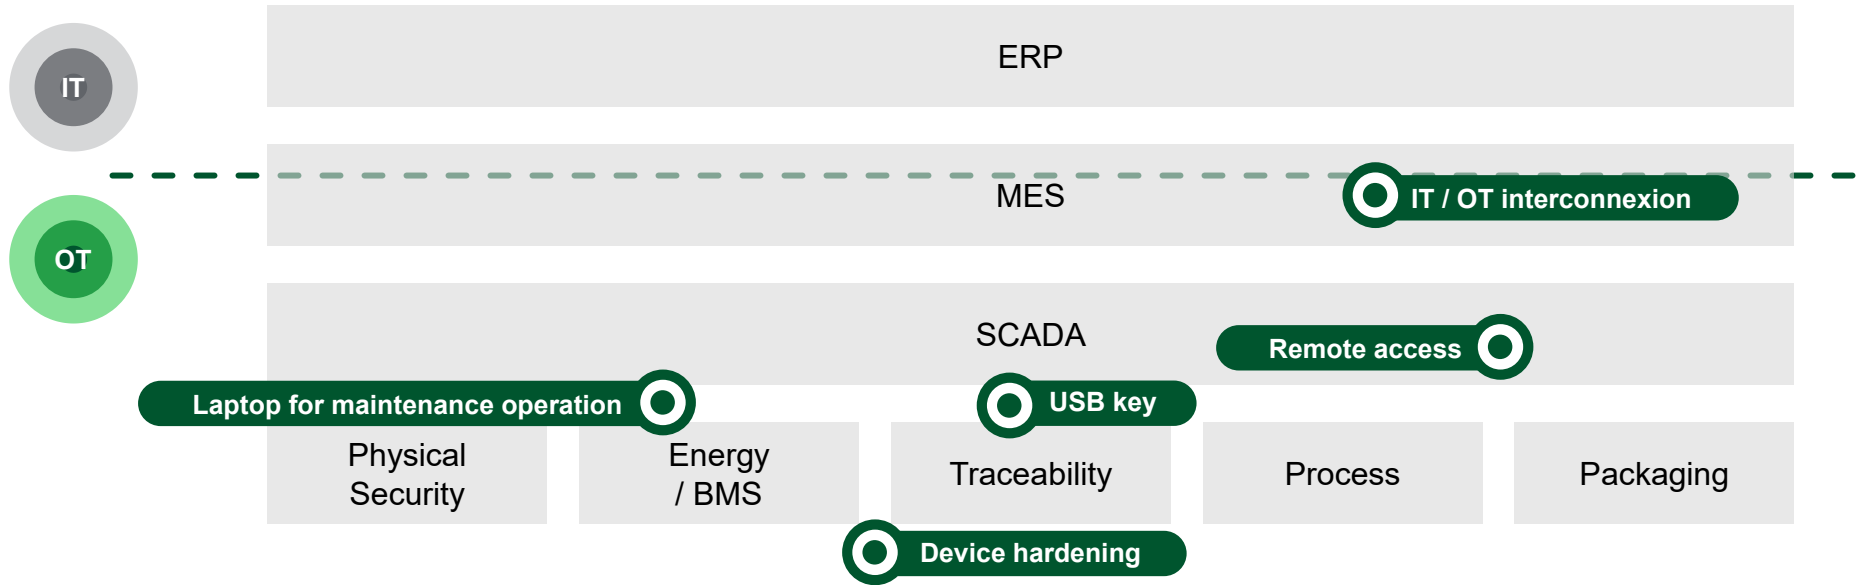

- Moderate Resources
- Moderate Motivation
- Sophisticated Means
- Specific ICS Skills

SL4

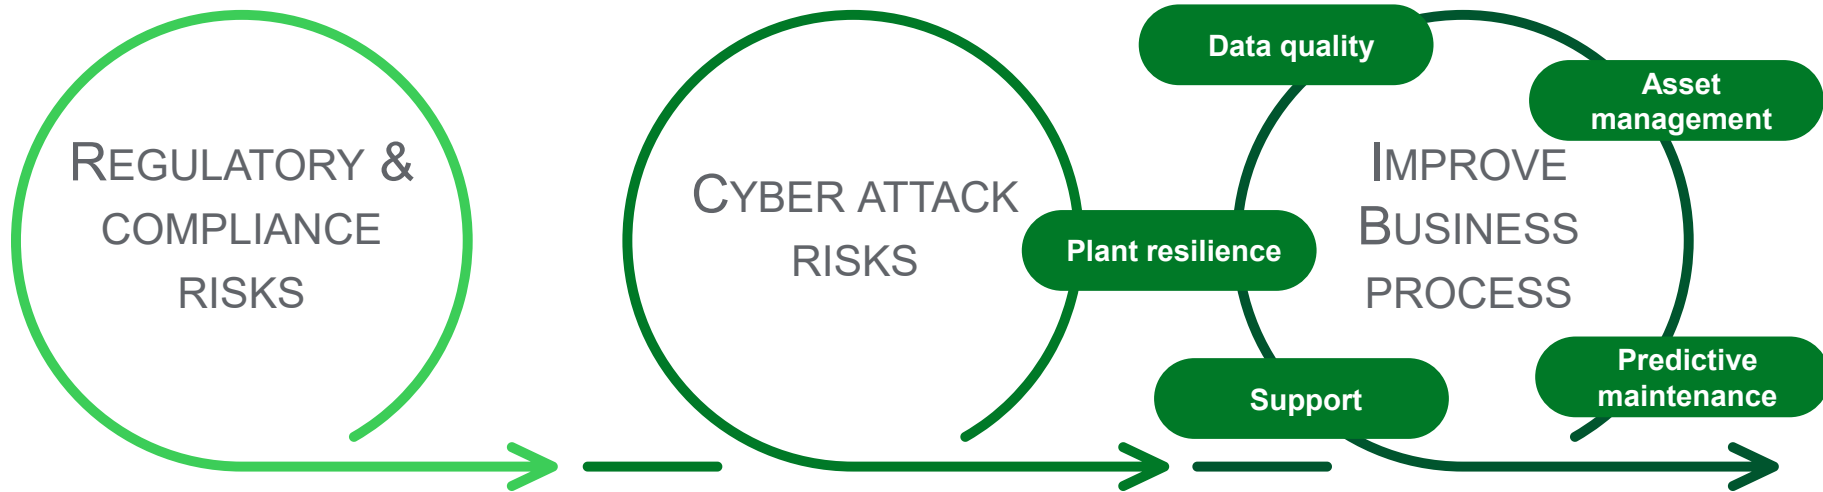

Nation state

- Extended Resources
- High Motivation
- Sophisticated Means
- Specific ICS Skills

# Major intrusion vectors with OT (risk points)

# Turning Cyber Risk into Business Value

# Typical OT Cybersecurity Journey in Food & Beverage

## Establish OT Security Foundations

- Security assessment
- Risk analysis
- OT policies & governance
- Cybersecurity roadmap

## Gain Visibility of OT Environment

- Asset inventory (know what's connected)
- Network mapping

## Secure Access to Critical Systems

- Network segmentation
- Secure remote access
- Least privilege
- Multi-factor authentication (MFA)

## Detect and Respond to Threats

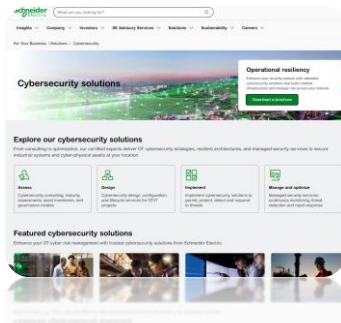

- Anomaly detection
- OT-specific incident response

# Take away

- OT cyber risk is business risk
- Start with visibility, Segmentation + access control
- Use frameworks, but stay pragmatic
- Prioritise what impacts production
